Hunting for yield - be careful what you wish for!

Hunting for yield - be careful what you wish for!

“Mountains of junk bonds were sold by those who didn't care to those that didn't think – and there was no shortage of either.”

Warren Buffett – Renowned investor

Driven by very low deposit rates and low yields on high quality bonds, some investors may well be tempted towards higher yielding investments, which are being aggressively marketed on the back of recent strong performance. Naive chasing of yield could be extremely costly. Beware!

Living in a low yield environment

It was only in the mid-2000s that some investors were beginning to doubt whether it was worth all the risk of owning an investment portfolio, given that they could get around 5-6% by placing cash on deposit with their local bank branch (or higher with Northern Rock or Icesave – but we all know how that ended).

Today, things are very different. The credit crisis and the ensuing recession has resulted in yields on lending (placing deposits and owning bonds) being driven down to all time lows, as the UK and other world governments dropped short-term interest rates and bought back bonds from financial institutions (quantitative easing) to try to stimulate the economy and to help the indebted masses – individuals, companies and banks - out of a big hole. The result has been a transfer of wealth from prudent savers to less prudent borrowers. For many retirees who supplement their pension income with interest from deposits, this has meant a dramatic fall in living standards.

The challenge for savers

Looking at the effect of inflation on depositors' cash makes for an even grimmer story – its value is shrinking quite dramatically. Take a look at the chart below which shows the trend in interest paid on deposits over the past 10 years, both before and after inflation. It is quite sobering to see that from 2009 to 2012 savers holding cash lost over 12% of the value of their purchasing power due to inflation.

The challenge for investors

The challenge for investors, i.e. those who own long-term, well-structured investment portfolios balancing bonds and equities, is a little different. A bit of insight into how bonds work will help to explain why. Bonds are IOUs where the borrower – a government or a corporation – promises to pay investors their money back at a future point in time (the maturity date) and a fixed level of income on it up to that point (the coupon).

The bond market, which is made up of buyers and sellers trading bonds, decides the level of return that is required to own the bond (its yield), given the current, perceived risks of lending the money. Because the coupon is fixed, the price of the bond must move to accommodate the new level of yields demanded by the market. If bond yields rise, prices fall and vice-versa – this is sometimes referred to as the bond see-saw. Broadly speaking, the longer the time until a bond matures the more the price moves in response to a specific movement in yields.

Since the credit crisis began bond yields have been falling for a number of reasons including the flight of investor money to safer investments, weak economic growth, a reduction in the Bank of England's base rate, a glut of global capital from cash-rich emerging economies and the impact of quantitative easing. That has been good for bond prices and short-dated bond returns have outstripped returns from deposits after inflation, as the diagram overleaf illustrates.

Data source: Dimensional Global Short-Dated Bond Index (hedged in GBP), UK 1-Month Treasury Bills

Figure 2: After inflation returns from short-dated bonds and cash

While this may sound like a cause for celebration as it has protected investors' wealth, the challenge is that, today, bond yields stand at an all time low. If they stay where they are, then returns going forward will be low. If yields rise, then returns will be poor due to capital losses eating up, and very possibly exceeding, the income paid on the bonds. What should investors do?

Temptations abound

The temptation and danger is that investors go on a hunt for yield, scouring the investment world for investments that are delivering higher yields. This is a route often taken by more traditional advisers and investors who think in terms of 'natural yield' or the cash income that a portfolio produces by way of coupon payments from bonds and dividends from equities. Let's focus on the bond side of things first to see why this might not be such a good idea.

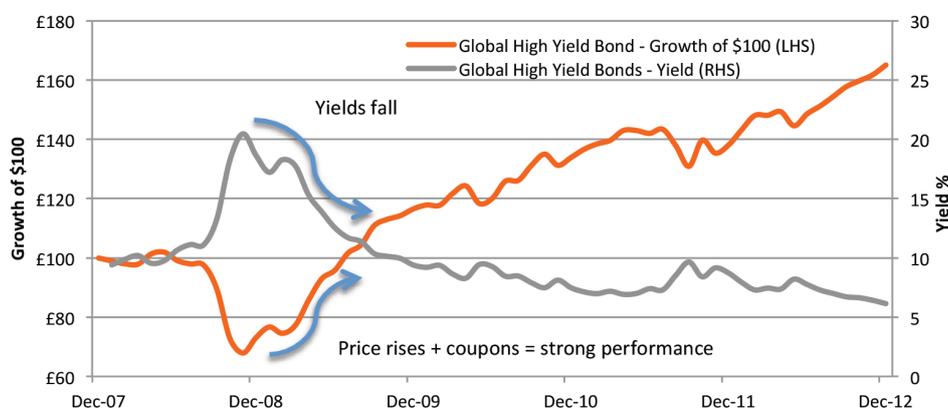

Bond investors have two key decisions that they need to make. The first is deciding on the maturity of the bonds they own¹, as longer-dated bonds are more volatile than shorter-dated bonds. This price volatility is known as interest rate risk. The second decision relates to the strength of the institution borrowing the money and the likelihood of being paid the regular coupons as they fall due and being repaid principal at maturity. This is commonly referred to as credit risk.

The higher the risk that an investor will not get paid back, the more return they will demand from the borrower. Bonds are categorised into 'investment grade' where credit ratings range from AAA to BBB, and 'non-investment grade' which represent ratings of BB and below. The latter are often know as 'high yield' bonds or, in a previous incarnation, the more descriptive name of 'junk bonds'.

The temptation is that the yield on a 10-year UK government bond looks pretty unattractive - around 2% before inflation - whereas the yield on a basket of high yield bonds is currently around 6%. In 2008 it was over 20%! One can see the immediate attraction. So, who are high yield borrowers? Here are few examples of sovereign borrowers with non-investment grade credit ratings: Mongolia BB-, Albania B+, Greece and Cambodia B-. The risks are evident. Many high yield issuers are companies whose names most are unlikely ever to have heard of.

Snake oil salesmen are out and about selling high yield bonds

In 2012 \$30 billion of US investor cash was invested in high yield bond funds. The ‘look at our (past) performance’ and ‘compare the yield to what you would get on a government bond’ themes are superficially appealing. High yield bonds returned over 11% in 2012 and have delivered strong returns since 2009. The chart below helps to explain why.

Figure 3: High yield bond spreads and performance.

The challenge lies in understanding what the future might hold – which nobody knows for sure. Looking back at the past and gauging what downside risk high yield bonds exhibit is a useful exercise. The table below provides an insight into the peak-to-trough declines that have been experienced since 1990.

Table 1: Drawdowns on global high yield bonds > 5%: 1990-2012

Peak Date	Trough Date	Decline (%)	Decline Duration	Recovery Duration	Recovery Date
May-08	Nov-08	-33	6	9	Aug-09
Jul-90	Oct-90	-17	3	5	Mar-91
Apr-98	Aug-98	-16	4	16	Dec-99
Feb-01	Jul-02	-12	17	6	Jan-03
Jan-94	Apr-94	-9	3	13	May-95
Jul-11	Sep-11	-9	2	5	Feb-12
Aug-00	Nov-00	-7	3	2	Jan-01

The insight is obvious - higher returns come with higher risks. It would appear that market timing skill is required to pick the good times and avoid the bad times. If an investor had the skill to do that (and the empirical evidence suggests that very few do), then looking at Figure 3 the best time to have bought them was in 2008 at the height of the credit crisis when everyone else wanted to own government bonds because it was very possible that the global financial system was going to crumble. Is now a good time to buy? No one knows, but it is definitely not as attractive as in 2008.

In addition, high yield credit risk tends to be quite highly correlated with equities and thus provides poor diversification in a portfolio at a time of equity market trauma. They are failing in a key role that bonds play in balancing equity risk for investors who own equities and they are too volatile for loss-averse investors.

Snake oil salesmen have equity products in their medicine bags too

The snake oil salesmen are also peddling a focus on 'equity income' stocks that provide higher dividends, which tend to be stocks that exhibit 'value'² characteristics. Some investors may even contemplate giving up some of the low yielding fixed income assets held in portfolios for higher yielding equities. Yet that makes little sense as equities are equities, however much income they might produce and will fall just as far at times of market trauma. Such a move could result in investors owning portfolios that are more aggressive than they may feel comfortable with.

The other option considered by some is to switch existing equity holdings to higher yielding stocks. Again though, the argument is weak. It risks concentrating the portfolio in terms of the companies held and also sector exposure. It is worth remembering that the price of an equity falls when cash is distributed to shareholders. Whether a company pays a dividend or not should make no material difference to the return generated over time.

So what is the solution to the conundrum?

Thinking in total returns not natural yield

While there are no absolute right or wrong approaches to investing, there are certainly some solutions that are preferable to adopt. Chasing 'natural yield' tends to trade income today for the material downside risks outlined above. A 'total return' approach, on the other hand, delivers an income to the investor from dividends and coupon payments and makes up any expenditure gap from capital. The main advantage of this approach is that it allows the portfolio to remain properly diversified, rather than becoming concentrated around credit risk in bonds and increasing sector and company specific risks in equities. The risk level of the portfolio is also maintained where it should be.

Some investors may worry about selling equities when they are down to raise capital in place of income, but given the regular rebalancing that takes place on portfolios, the likelihood is that in this scenario fixed income assets will need to be sold to rebalance the portfolio back to its original mix between bonds and equities. If equity markets have risen, the issue is of less concern.

It is worth noting that a total return approach is now widely accepted as a valid alternative by institutional investors. In fact, in the US, it is required by the Uniform Prudent Investment Act, which defines the standards that any fiduciary is held to, along with the ERISA legislation governing the management of pension funds.³

Conclusion

Sticking with a strong and flexible financial plan and a well-diversified portfolio is a better option than chasing higher yields, blind to the material risks that are taken on by doing so.

End notes

1. In fact the measure that is used is 'duration' which provides an indication of the sensitivity of a bond to a set movement in yield. It is measured in years. If one takes the duration of a bond portfolio and multiplies it by a specific rise in yields, the product is an approximation of the capital loss to the price of a bond. For example (8 year duration bond) X (1% rise in yields) = 8% capital loss.
2. Value stocks have higher risks than the broader market and are expected to deliver higher returns over the longer term. As a generalisation, they tend to relate to stocks that are less financially healthy.
